

MODEL RAILROAD LED STROBE

It seems model railroaders are searching the Internet for a modern LED strobe light for their layouts. One has been designed by David A. Johnson, P. E., under the name of "Model Airplane Wingtip Flasher" (next page). I adapted this circuit to use with my train (see video).

The circuit board fits nicely in Model Power's lighted water tower. I built a voltage regulator in the base so it can be used with most dc voltages.
